In this Lab 4 I get a in depth process of how words are turned into numerical values for computers to understand, also getting a more in depth of NTLK or Spacy process of breaking down the word count and meaning of how a LLM can know what the emotion and contrast of the sentence means.

During the start I was lost not knowing how this all comes into place but after going through it one by one I see why it's important to have this implemented. It’s like cooking bread, super simple but easy to mess up any steps if you don’t take the time to know what you're doing. I see this process as making it, cleaning your text as having everything prepared, and getting ready to follow the steps as we did for the preprocessing. Everything comes in together as it fits perfectly on to each other like building legos.

After seeing how everything comes into place I know what to do for the start of a preprocessing, each step taken in carefully because one misstep can mess up the data. The thing that surprised me the most is how each application has its own section to be used for. BOW for basic stuff to get a count on while for TF-IDF for search engines to have a deeper overview. Each one weighs each other out on the scale as having different eggs in a basket is key for this.

The biggest issue I had with this lab was the coding, I’m still getting used to complex coding as python and having math thrown at me is a roller coaster. So learning how deep it is for each application to have their own coding is key to keeping everything separate. But learning from this is giving me hands on work as if I’m put into a scenario to do something like this I know what I can do

Thus after this lab I give my props to those who knew to create this, because I know text clearing was key but didn’t know this was another key step to have, I enjoy having to put everything together and seeing the examples of how each one worked. Learning knew terms that were different and not that simple to understand at first, but after I learned how to teach someone this. I will be taking this key into my mind as this can help me in the long run if I want to build a LLM or preprocess data.
